

## **Preliminary Instructional**

A form that the user can fill out to assess their current risk for ACL injury, with links to further educational content to help the user avoid such injuries during exercise.

## **Intended Audience**

The intended audience will have some hobby or occupation that puts their ACL at a slightly higher than average risk. They will likely have some background information but are not expected to be specialists.

## **Task Analysis**

To create the final document we will work with the subject matter expert to create criteria that users can enter into a form to rank their current risk of ACL injury. We will also work with the computer science students to make the form and to make sure that it is usable both for the users to enter their own information and find further resources and usable for the subject matter expert to collect and interpret the information.

## **Tentative Design Plan**

ACL website already exists and requires an account. The website requires the form that we are creating, which will be mobile optimised so that it can be accessed away from formal offices and larger computers.

When the user first enters the website there should be a short summary or indication of the websites purpose. Below that will be the form. After the form is submitted the user will be directed to a brief set of resources in the form of links with an overview of the linked content so that users can find further information based on their personal needs.
