

Nominal Use Scenario

Scenario One

Kurt Daniels uses the search bar to type in the last name “Aho.” With so many results, he clicks on some of the filter options, such as “Workers” and “Directories.” The results are narrowed down, but still too many. So he clicks on a year and skims through the results. There are 30. He eventually finds the name he’s looking for and selects it. A pop-up window appears with information on this specific Aho, such as his family members, his work history, his address, and his heritage. Certain information is highlighted so that it can be selected if Kurt wants to find out more about other places or people.

Scenario Two

Shelley Turner uses the search bar to type in the address of one of the buildings in downtown Calumet. She loves the design and wants to know who made it and how it was used over the past century. She uses the time filter and reads every story that is connected to the pop-up information for said building. Once she’s finished in one time period, she clicks another one and repeats. Occasionally, she will click on the name of one of the people who lived or worked there, and follows their history for a bit.
