Changes after Final Design Presentation
04/05/2021

- Added Tooltips that appear when a user hovers over a parameter in the simulation menu.
  - Feedback reported that it is confusing for users who aren't familiar with viral threshold/other parameters. So we added a tooltip to provide some educational content for the uninitiated.
- Changed the On/Off buttons to be more clear
  - Initially the buttons were very unclear on whether clicking sets it to on or off. Now we have changed it so it is abundantly clear what the button is set too.
- Changing how we set up the board
  - Still a WIP, but feedback reported that clicking on all the different cells one at a time to make changes could be tedious, so we are currently working on an alternative solution
- Added default values to the simulation.
  - Feedback suggested that adding default values to the parameters when loading into the simulation would make things a little less daunting, so we added good default values.
