

The system will store analogies for computing concepts. The system will allow for viewing and searching for analogies. The system will show these analogies in a list, in a shortened form. When an analogy is selected, it will expand to show all the information. The system will also allow for creating new analogies, favoriting analogies, and comparing analogies. The system will have 7 pages, in total: browsing page, analogy information page, analogy creation page, comparison page, user page (also shows favorites), a signup page, and a login page.

The system will use the Grails 5 Framework, H2 Database, and h2-console. Programming of the system will be done on IntelliJ IDEA.
