

Final Review Notes and App Improvement Ideas

Final Meeting with Scientists: Friday, April 28th, 2023

Notes

- Mary is currently attending a NASA conference and mentioned the site to her colleagues. They may look at the app and potentially market it. She wants us to put together a short bio for each of us if they publish the site on NASA
- Meet with Mary next week to show her how to update the locations on the map. Also put together a document that goes through the process of how to update and upload the site.

App Improvement Ideas

- Map locations show different icons depending on what type of green space the location is.
- Show the different locations in table view as well as a map view. Users would be able to hover over a location and it would be highlighted on the map.
- Map upload functionality
 - Users have the ability to upload new locations to the map. This is one of the things we were hoping to complete during the project but ran out of time. Having the ability to have users upload new locations and images of those locations would make for a better user experience, and could be used as a research tool
 - Users would be able to log in, see what locations they have uploaded and what “score” they have for green space uploads. The users would also be able to comment on the locations which could be seen by other users.
 - Admin login to allow someone to “filter” through submissions and approve them. Admins would also have a table view to look at locations, add them directly, and use it for research purposes.
