- When connecting multiple devices streaming to one or multiple graphs?
- What is modified data?
- Is connecting done completely through the browser?
- Plan to generate an easier to read display of data?
- Is there a way to access old data once new data is shown?
 - We compress the graph so all data is still shown
- How can you distinguish between micro-bits with the same name?
 - How will we handle naming micro-bits?
- How do you handle two micro-bits handling two different kinds of data?
 - Potential Stretch goal

-Class

- Selectable legend
 - Highcharts has this implementation
- How do we graph multiple data types from the same micro-bit?
 - How would colors work etc.

-After thoughts

- Make the option to create multiple graphs for different micro-bits
