

App Idea

I Want to divide the idea of the application into four areas of interest.

1. The Idea of the app focuses on educating the general public about the GSI and develop the application by loading the Geographic locations of green spaces and data such as observations/images with the help of high school students.
2. By developing this application, the public will learn about the importance of GSI and help in reducing the flood risks.
3. As the application is already developed with the outline of features , the Scientist wants them to be more functional with respect to the Maps feature.
4. Downloadable excel files for users to view the observations.

Users:

General Public : Should be able to access the application and learn about the green spaces.

High school students: Should be able to access the application and allow them to add the images of the locations and observations of the area.

Scientist : Is the admin of the application and will have the overall control of all the features in it. Such as adding ,modifying, deleting the content from the application.

Users	Goal
General Public	Learn the importance of green space Infrastructure.
High School Students	Use the application to add the information such as observations of the locations and images. On the either side they should be able to see the information added by other users as well.
Scientist	Will have access to all the features of the application to enhance it through the data collected by the users of high school.

Notes : Scientist is ready to receive more ideas from developers to make the application more interactive.
