Green Stormwater Scientist interview 2

- I. Scope of Project - What to Focus on Most
 - A. Having a map where images can be easily uploaded is most useful. Jess provided an example of what we could use for inspiration.
 - B. <https://detroitstormwater.org>
- II. Moderation/Accounts
 - A. Since individual accounts are complex, we would have moderator accounts and a student specific login. Need a focus on security for the student login, but would save time. Jess wants it so multiple users can use the account at the same time on different devices, and the data should be viewable without the login. Just highschool's name rather than student information will be stored on the site.
 - B. For moderators: the current idea is to have any moderators remove photos from the app, but less work to approve every single upload before they go through. Jess thinks this plan is ideal for the scope of the project. Jess doesn't think the teachers should serve as mods, only she will have the position.
- III. Operating System:
 - A. Jess wants it oriented for phone use primarily, since it's the easiest way to get and transfer pictures quickly for high school students.
- IV. Location data:
 - A. Jess wants to focus on SE Michigan, and for each data point given be shown with the correct coordinates on the map, lining up with actual greenspace shown on Satellite imaging.
- V. General Aesthetics:
 - A. White is preferable for the main website color and a good looking aesthetic over the old app. Jess has no preference for any images, but would be open to appropriate ones should the team want to include one.
- VI. Conclusion:
 - A. No further questions from Jess.
