

We as an app have decided to not have a database and instead save the data cached on the users phone using redux persist. This stores it locally on the storage of the device and can be reopened when you initiate another session.

We would call local storage and save the keys in an array, the values would be the JSON files

Keys: Ingredients, Pantry, GroceryList, Recipe1, Recipe2, Recipe3, Recipe...,

Values: Ingredients JSON, Pantry JSON, GroceryList JSON, Recipe1 JSON, Recipe2 JSON, Recipe3 JSON, Recipe... JSON,
