

Design Change Document 2

Mar 31, 2026

1. Change spacing between messages from the user and the agent

We decided to change the spacing between the messages from the user and the agent, as they were not as responsive to the size of the screen as we had hoped. We plan to match the spacing used by other popular messaging applications, like iMessage for Mac.

2. Fix Report Generation

We're working on fixing the report generation feature to make sure the site is working at its full potential when usability testing begins.

3. Add emoticon feature

We're implementing the emoticon "knowledge meter" feature to help users understand how the AI Agent feels about the topic. This should help users know whether or not their prompts are helpful, and may give them a hint when to end the conversation.

4. Add minimum specifications to the help page

We're planning to add to the help page the minimum device specifications required to run the application, since it doesn't run on most devices. This will help users troubleshoot potential problems with the model.
